

ALKALIVE™ pH Stix

phion pH Stix™ are unlike most pH test strips on the market. Due to the narrow range in pH of these bodily fluids (generally 5.8 to 7.6) it is imperative that a pH test strip give a clear indication in small pH unit increments. Ours do. Our test strips give an indication in .25 pH unit increments, and test a range of 4.5 to 9.0. Plus, pH Stix use the double color indicator method, allowing for a more accurate determination of the pH value of what you are testing. Throw away the pH paper, and pick up the pH Stix.

80 strips per pack

pH Stix™ come complete with directions, indicator color chart, and a guide to how to interpret results.

Compare **pH Stix™** with standard pH paper from rolls. Paper tends to bleed when it gets wet, making the determination of the correct color quite a challenge. pH Stix are different- the reagent is affixed to a plastic strip. No paper, no bleeding, no mess; easy testing. pH Stix pH Test Strips - the clear choice.

pH Stix™ come packaged in a pack containing 80 pH test strips.

This is what Dr. Ted Baroody, author of **Alkalize or Die** has to say about **pH Stix™**: "I get hundreds of calls for pH testing materials. pH testing is very complex. There are individual pH testing substances for everything, but they are very expensive. This particular strip is reasonably priced too. I have looked a long time and through many companies to find these quality pH strips. My experience with litmus pH paper strips has not been good. I do not recommend them."
